

wipe out directory tree through rsync

To wipe out a directory tree on a rsync server (an export) which you don't have shell access to (but proper write access of course), just use this command:

```
# rsync -av --delete /tmp/clear.me/ rsync://some.rsync.host/some.export/
```

/tmp/clear.me is an example for a local but empty directory (empty as in 'mkdir /tmp/clear.me').

Putting the slashes at the end of both local and remote path will allow you to sync the empty directory onto the server, effectively removing everything on the receiver side.
